Botox:

What is BOTOX Cosmetic?

BOTOX Cosmetic is a prescription medication injected into muscles in the face to temporarily reduce the appearance of frown lines and wrinkles between and around the eyebrows.

How Does BOTOX Cosmetic Work?

BOTOX Cosmetic is injected into the muscles in the forehead, in between the eyebrows and around the eyes to reduce wrinkles and lines. When injected, BOTOX Cosmetic relaxes the muscles in these areas to lessen frown lines that come from age. Many patients inject fillers into wrinkles and lines following BOTOX® Cosmetic injections as a way to plump them up.

What is the Procedure for Injecting BOTOX Cosmetic?

BOTOX Cosmetic injections are done within minutes. While any healthcare professional can administer BOTOX Cosmetic, all of our providers specialize in cosmetic procedures like injections and cosmetic fillers. They are very experienced in administering BOTOX Cosmetic and will talk to you about this procedure, whether you will benefit from it, and answer any questions you may have.

What Areas Benefit from BOTOX Cosmetic Injections?

In general, dermatologists most frequently inject BOTOX Cosmetic around the eyes to lessen crow's feet and on the forehead to reduce frown and furrowed brow lines. Additionally, they treat prominent neck bands or cords, fine lines on the upper lips, marionette lines at the corners of the mouth and rippling at the chin. Physicians may also use BOTOX Medical to treat patients suffering from excess armpit sweat, soles of sweaty feet, and the palms of the hands.

When Will I See Results from BOTOX Cosmetic?

The marked improvement from BOTOX will begin to be visible within days with continued improvement for over a month.

How Long Does BOTOX Last?

BOTOX injection results last for about four months. If you choose to discontinue receiving treatment, the lines and wrinkles gradually become more apparent just as before starting BOTOX® treatments.

Post Treatment -> Botox

Botox Post Treatment:

Botox Injections: Post-Treatment Instruction

1. Because there is no sedative or anesthetic used, you can return to normal (but not vigorous) activities immediately after the procedure. It is possible that you may experience a mild headache after the procedure. You may take acetaminophen (Tylenol) if this should occur.
2. For the first 4 hours after the injection you must:
 - a. Keep your head up, not stoop or strain.
 - b. Not massage or manipulate the treated area, though you can apply light makeup after 1 hour.
 - c. Not take any naps or sleep in a reclining position.
 - d. Exercise the remaining facial muscles by frowning or smiling frequently .
 - e. Not take aminoglycoside antibiotics (e.g. gentamicin, tobramycin, netilmicin and amikacin)
3. After 4 hours you may bathe/shower normally and apply regular make-up.
4. You may resume your normal schedule of exercise and activity after 24 hours.

Notes:
